A Glimpse of the Literature on Geo-economic, Psycho-Social and Political Elements Upsetting Migration

Insha Rasool[a][1][1], Syed Inshaallah Tahir[a], Shazia Jan[a]

[a]School of Education and Behavioural Science, University of Kashmir

Article	Abstract
	Migration is the third element that determines population changes, after birth rate and mortality rate. This occurrence is influenced by economic, social, geographic, and political variables. 'The human species is not a migratory species, but it is a restless one that moves in response to its social, economic, cultural, and ecological surroundings' (1984). In this study, the human migration behaviour was probed and reviewed in the context of social, political, geographical, and economic factors. This research and evaluation of the literature provides insight into migratory behaviour as it is influenced by geo-economics, psychosocial, and political aspects, as well as the good and bad effects on people. People from various geographical and economic backgrounds will promote the spread of new ideas and the study of new languages, assisting people in developing skills for working in various parts of the world/country. However, this section of literature goes on to say that the majority of people are forced out of their communities because they don't have enough possibilities to live a pleasant life and are dealing with various psychosocial issues.

Introduction

The movement in which a person or a group of people interchanges from place to place, in order to settle down is called migration. This is over and over again revolving round a boundary, may be political or administrative. It can be for less time or long time and it could be conscious or deliberate. It is well-known from historical point that individuals at all times have been in movement from one region to other and had poles apart migratory lifestyles. So, it is not a novel concept. After birth and death rate, migration is acknowledged as third factor in variation of population. It disturbs the density of population differently, as compared to birth and death rates. These said dynamics are biological in nature but migration is not as it is influenced by different elements like social element, cultural element, psychological element, political element and geographic element. Systematically demarcated the migration and indirectly set up the connection between migration and the process of increasing in population. He was correspondingly of the view that migration neither increases nor decreases the population from the absolute population of the world, somewhat the grand total population can have

Email address: Inshabhutt@gmail.com

effected by movement of people from one place to other where they are likely to yield minimum to areas or maximum to areas or vice-versa [1]. Migration consists of the movement from one place like country, township or household to other place [2].

Migration is that practice in which an assemblage or system of different things that are linked in a close or complicated way, like a network is one of the component of population change [3].The important network has been provided by migration in order to spread or scatter the ideas and information. It can be regarded as a small alteration or movement made to achieve a desired fit to problems of economic, ecological and social elements. It also postulates the symptoms of having change due to social and economic problems [4]. Migration related to change in physical space [5]. Based on his view point, all ups and downs in physical space related to all association with the acceptance more or less have been suggested though not directly, but accepted that change of domicile i.e. a person treated a specified country as a permanent home was involved. Besides these, the greater or lower ceaseless movement from village sector to cities, from well-balanced areas like the areas having stable population moves to the commercial or industrial sectors for better opportunities.

The different types of cyclical migration i.e. movement of people from rural to urban for the welfare of their good life, and ultimately comes back to their birth place or home town after some days or months could not be embraced as these are for farthermost at retirement etc., also poses few complication in different types of cyclical migration [6]. Humans are restless one; they are not included in migratory species as they are in unremitting movement for progress of the process of change which is better suited to its social aspect, economic aspect, cultural aspect and ecological aspect [7]. The definition of migration on the subject of change in space-content and space relationship of place has been stated that migration is not only shifting, it is the forming of necessary base to comprehend the space content and space-relationship of place without any interruption or gaps [8]. Migration implies non-attachment from the association of all activities at one place and the grand total activities of other place [9]. The different forms of migration are – rural and urban migration, deliberate or unintentional migration, impelled migration which is also known as reluctant or imposed type of migration.

Rural-Urban-Migration

Rural- urban migration is that form of migration in which pastoral people migrate to metropolitan spaces for superior lifestyles, and for healthier job opportunities. Different studies have been done in eighties, which demonstrations the dissimilarity in state's income and the Indian sectors are going in different direction i.e. divergent in nature instead of approaching each other or tending to move towards one point i.e. convergent in nature in terms of progress, growth and development. This takes place because of private sectors as they are investing in small pockets which are farther complemented by the prime public sector in terms of location and infrastructure.

At present, the overall economic growth of large and well settled cities are in center of interest. In eighties, there was shifting in the inner-city sectors but in nineties big and well settled cities were in favour. Planning has great role in state and creative people as they have authority and potential to form the urban space, it is govern over and done with laws, and its expanses are govern through figurative campaigns, and at last allocate precise meaning to city. While in comparison with state and resourceful people, in influencing the urban space, the deprived have very few possibilities to shape it as they plan and direct through the existence of urban space [10]. In spite of that, they design out a particular habitat shared by outsized number of persons in which every single of the person is confined to its own microhabitat and withstand the central act of assumption of the urban space by strong as revealed in a study of squatters and street vendors in Tehran [11].

Forced or involuntary Migration

Forced or involuntary migration is that category of migration in which people are forced to migrate by innumerable authorities and government for any tangible reason. Refugees and internally displaced persons have been migrated, and countless people are also evacuated due to natural catastrophe, disasters, famine, drought or ventures associated to development. Forced migration comprises of voluminous diverse possessions that are linked in a close or complicated way and also it is a prolonged set of event. An innumerable number of examples have been drawn in order to make an effort to accomplish the wide-ranging range of the factors contained within in forced migration. In general, refugees and internally displaced persons are every so often discussed in the literature of forced migrants.

Impelled Migration (also called reluctant or imposed migration)

In impelled migration people are not compelled to migrate, they choose to travel by own due to few push factors like war like situation, hunger, food crisis etc. There are quite a lot of ins and outs due to which persons migrate. Migratory causes may fall under these categories: Geographical, Economic, Psycho-social and political. The other migratory causes may be push or pull factors. Push or pull process are the explanations for prevailing migration, i.e. those state of affairs are pushing out people from one dwelling to other which is not favourable to them and on the other hand some new and external feasible condition try to pull them in [12]. Push factors as those factors which had a deprived way of life and pull factors are those one which had an excessive role in better daily life conditions, also viewed that push factors are those one which drops the socio-economic aspects at inborn place and pull factors are those one where a person gets better life breaks at target place.

Push and pull factors are the sub-divisions of migration, conferred that pull features are those aspects which are pre-eminent for high standard of lifestyle, best for well facilities of education. Also further stated that these pull factors, which are in authority for an individual or group to leave or migrate from their native place. He labelled these factors as place utility i.e individuals are paying attention by the fitness of continued existence of the place. People have been pulled for enhanced trade and profitable opportunities, for superior standard of living into the desired locations. Although push aspects are those one which bound the individual or group to drift deliberately, and in specific cases, the individuals or groups are not sense safe to stay, so they migrate. Fight, drought, food shortage or happenings correlated to religious are moreover included in push factors [13].

Review of Literature

It is mostly acknowledged that relocation has a number of reasons like:

Geographical and physical factors

Geography and migration are two terms that are inextricably intertwined and so cannot be separated. The study of migration has been important since the dawn of human life because of the phenomena of human impatience, which has remained associated with it since its inception. In the early days of migration, the impression of movement was not as varied, since a modest level of life was being adopted at the time. Humans were regarded as nomads at the time since they used to travel around for the fundamental inevitabilities of life. There was no concept of societal, trade, or industry life at the time; all that existed was a spatial change, i.e., a shift in location.

But, as time passes, civilisation emerges and, day by day, becomes far more advanced, prompting and compelling people to stay in a single location for everlasting residency. Humans remained subjective to the gathering of worthy liveable and agricultural accommodations while migrating to the actual area and this spatial shift was accompanied by economic development. The study of migration is becoming increasingly complicated and composite in nature as a result of greater invasion and regional shifts in civilisation.

Human migration's causes and consequences are not simply a concern of geographers; human migration is also influenced by physical features, with time and space playing the most essential role and importance. As a result of the aforementioned causes, human passage varies.

Natural death traps such as volcanic eruptions, subsurface eruptions, landslides, soil degradation, climate variations, and other natural disasters have impacted migratory methods throughout history. Individuals prepare to migrate from their natural environment in order to avoid such challenges. In the beginning, one of the most significant components of relocation was epidemics, which people saw as a powerful force motivating them to move from one zone to another. However, in the not-too-distant future, these dynamic forces were rendered insignificant by advances in medical technology.

Nowadays, scientists are in performance of boundless role to bring deviations in expected conditions, so that physical aspects have not turn out to be much more insignificant. Scientific innovations have left no place untouched i.e. irrigation conveniences have touched the land of deserts making it fit for hominoid inhabitation and agricultural production. Science is demanding to ease out every single scratchy condition like the invention of air conditioners and for enhanced harvest production weedicides and pesticides come into advancement and making the fantasy of green revolution reality.

People are motivated to migrate by climatic conditions such as an unfavourable and wholehearted scenario. In the summer, people flock to a captivating fitness resort, while in the winter, they flock to a warmer region to avoid the unpleasant season. One of the prominent impacts of migration is climate alteration and it is discussed besides other factors of migration, the utmost essential feature are climatic changes like scanty rainfall, temperature fluctuations and seasonal variations had greatly exaggerated the under privileged sections of the grand total population and their sustainability , which in turn had required these individuals to migrate[14].

Economic factors

People generally roam for enlightening the financial conditions, social status, enhanced way of life etc. Freedom of movement of manhood is one of the strongest motivation through which economic condition of province gets disturbed. Rural and urban parts experienced the increase and decrease of the number of manual worker respectively. The purpose for the expansion of industrialized and money-making accomplishments is as of the movement of labourers or artisans from rural to urban extents and this in turn has improved the bargain of urban areas. Folks over and over again migrate from pastoral to metropolitan areas for recovering conveniences like education and employment. Researchers have brought into being that it is the involvement of economic motivation that usually assures the people for migration. Poverty, over population, and lack of jobs are few conditions widespread in Europe during the 1800's. As a result, many Irish, Italians and Germans decided to go live in the U.S.

The real ground of migration found by Gulliver is trade and industry necessity. On the other hand the outlook that for the healthier economic conditions educational migration plays a central role because merely education has magnificently contributed in developed innovation, respectable income, up-to-date technologies and economy growth [15]. Negative consequences of migration cannot be unheeded at once like it has affected the superiority of education, wear and tear of manpower training, building it a great damage of economy [16].

The mother of all causes- poverty and the mother of all diseases- malnutrition and unhealthiest are intolerable management; confrontations and scarcity have brought about a massive whereabouts of refuges affected by said factors [18]. Higher ambitions are one of the central foundations of deliberate relocation as it is objective established self-decision.

People are as well motivated for migration because of the inordinate transformation of pay scales presented at diverse places for the identical job and in this manner creating negative effect on entire

economy [19], it is therefore easy to point out that the students have both push and pull dynamics in order to migrate [20] and the government have to challenge the brain drain of galaxy of intellectuals. Better fitness facilities and for good trade and industry conditions, the village people every so often migrate from one residence to other. The in-availability of relevant professions for the diverse artisans pushes them to migrate. The number of whys and wherefores which directed people to migrate includes indebtedness, unsuitable weather conditions, unemployment, homelessness and above all the misfortune. A number of people are of view that metropolitan zones do fascinate us for the reason that of the being there of industrial hub and healthier financial and economic conditions [21]. Also has specified more significance to economic factors for rural-urban migration. Above all, the mother of all causes i.e. poverty has been highlighted [22].

Psycho-social factors

Social occurrence and domino effect of human migration have been examined by some great Sociologists, which in turn deal with the problem of migration differently. People attempt to form a gaggle on the idea of caste, class and family upbringing and they classically inaugurate a tough bond on said causes. While building the strong bond to the number of caste, class and family circumstantial they face problems in tons. For them, modification with the migrants of innumerable ethos likewise similar to unique habitants is a big problem. In the 1800's, Italians were restricted by social class. "If you were born a peasant, you would up the social ladder". As a result, many Italians began to immigrate to the U.S.

One of the most vital determining factors of migration is marriage, as immigration due to wedding is where newly wedded brides migrate to their respective groom's home. Quite 17% migrations are marriage interested of inter-district migrations in India. Bridal migrations hold the very best share in the midst of all types of migration [23]. After post wedding, a bride has got to transfer from her native home to her in-laws home. History is itself perceived that populaces used to plan marriage of their offspring within a brief distance of an area, in order that they will visit repeatedly and without difficulty on and off, but due to fast evolvement in communication and advancement of transportation conveniences this distance has amplified automatically. Furthermore those people that like well to choose inter-caste marriage rather than planned marriage by family are mostly hated by their associated persons and in such circumstances they requisite to move out as of their innate place to have need of indispensable requirements of life like bread and butter, roof over head in well settled built-up areas.

People are more inflexible in terms of spiritual ways and means and main beliefs that are inherent in rural extents in pious preoccupied with countries. In mandate to keep an eye on customs, out-dated and sacred individuals are constrained socially and morally both. It is correspondingly accurate that self-regulating intellectual and practice has been ceased as people are not getting the opportunity to express their highlights and the one who endeavour to express are bound to migrate socially which in the long run leads on the way to the migration in built-up areas. Not only the spiritual, societal or customs of the rural community are ins and outs but they are also hemmed in by the guidelines and protocols of the combined domestic family which in turn influences them to migrate and go out or leave their birth place to measure an self-determining elements of life.

Political factors

One of the vital dynamics in migration is political factors which cannot be overlooked. Innumerable incidence of relocation in more than a few poles apart countries is linked to politics. Australia is still sparsely populated as migrants are not permissible to settle down due to administrative restrictions. Constraints have been placed frontward by many further well developed motherlands by altering laws connected to immigration and mass movement of individuals has remained prohibited. Conduct like step mother has been detected by certain nations as they didn't treat wanderers at same level with their own citizens. Even if expert witness like administration tries hard to reimburse and simplify these migrants but the dwellers of that extent compelled and involuntary these migrants to leave or move out

from their countries. After 1948, most of the rural people migrated to urban because of safety in Myanmar.

At the time of wars, people wander on and off as of one residence to other as refugees. Outsized scale relocation has been done by the cause of World War 1 and due to its effects. India and Pakistan dividing wall is one of the best illustrations of inhabitants" allocation due to politically aware end product on migration. Without any distrust migration is widely noteworthy hemmed in by the up-to-date conjuncture- course of action programmes and purposefully come up with the money for an area on mass media at election times were a matter of concern and both clockwise and anti-clockwise acknowledged unruffled of the foremost vital concerns of public in opinion polls [24]. Physical as well as party-political ins and outs like tidal wave, dearth, underground eruption, and epidemic and hostilities dislodgment judgment are thanks to enforced migration.

The Jews were persecuted for many years in Europe, especially during World War 2nd. Many decided to leave and find new homes in the U.S and other countries. Communist governments in Europe and Asia placed many restrictions on the people there. Many people from Poland, Russia, and other countries decided to leave to find freedom.

Migration due to forcefulness has been reported, also the assessment that violence results in migration and lower savings, argued that violence is key cause encompassing in migration. Moreover, even after violence, people doesn't move mostly within the sort of Guerrilla outbreak in Columbia, on the other hand as an outcome of attack, their saving amount fell down and to catch up the damage of assets they are enforced to go left the inborn place [25].

Encouraging and damaging waves on migration

Migration plays a prominent role in cultivating the quality of life in people. It helps a lot to improve social aspect of life of people as they gets acknowledged about novel culture, customs and languages which in turn helps them to improve brotherhood among people. Skilled workers plays leading role in acquiring greater economic growth of the region because of migration. The distribution of the population is uneven in India as migration changes the size and density of the population of place. Lots of migrants are completely ignorant and uneducated; therefore, they are not only out of shape for maximum jobs, but likewise lack elementary awareness and life skills. Poverty styles them incompetent to live a standard and hale and hearty life. It is challenging for a villager to endure in built-up areas for the reason that in built-up areas there is no natural environment and pure air. They have to pay for every single piece and everything. No doubt, being without a job is condensed and general public get enhanced career opportunities, intensification of share of land holdings, improvement in the economic condition by the construction of worthy house etc. At the same time, the social prestige of the household improves for the reason that of learning and enhanced social contacts. Nevertheless it has been perceived habitually that individuals take delivery of their basic training (methodological or general) at the dwelling of their starting point but they on the odd occasion work for the domicile of their origin.

The waves of migration on a technologically advanced area are encouraging for the reason that of which sophisticated young people migrate to these areas, in that way providing them large quantity of practiced people to this area. At the same time, the waves of journey on that area from which they wander has negative impression as these young skilful youth didn't work for their area due to non-existence of employment opportunities, which induces the unemployed to migrate to the cities in pursuit of well openings of a sought after livelihood and to intensification in their income. The inhabitant dimensions of these areas are accumulative at a considerable more rapidly rate. This astonishing growth in residents leads to the establishment of slums, banned construction, disorganised progression of towns, means of transport problems, unavailability of civic efficacy filling station and informative facilities. Countless times migratory staffs take up a reduced amount of desirable, menial contracts which in habitants would not proceeds but are of high collective value in this context the host place can

acquire skilled labour force at inexpensive market rates. In this approach the gap in deficit constituencies may perhaps be chock-full by asylum seeker labour. No single is this but the price tag of giving up work reassigned to the creative habitation of its origin. The offspring of migrant employments prerequisite to stand educated; they ought to be acquainted with the innovative ethos and phonological of the host state/country.

Furthermost of the times there is overdependence in a number of productions going on migrant labour, most important to a deficiency of professions for persons inborn to the host state/country. Considerable of the bread received by migrants is not used up in the host state/country and is in its place spent back to the state/country of origin. Migrant labours at all times rise the gravity on possessions and service area such as fitness maintenance systems. Due to migration the design of a multi-ethnic society upturns thoughtful and open-mindedness of supplementary cultures. The progression takes end to end new-fangled or rejuvenated services. People as of new states/countries will raise your spirits the giving out of innovative accepted wisdom and book learning of first-hand languages, facilitating populaces to ripen expertise for working at poles apart zones of the world/country. Normally, the masculine are utmost inclined to relocation there is dominance of males, specifically in the social order wherever womenfolk previously have a little status. Living in an altered atmosphere will disturb the cultural uniqueness of the migrants and their self gets lost, exclusively in second age band children. Folks wander aimed at fully clad standard of living. Many provinces in the motherland are unfledged / meagre and that is the cause they couldn't live up to the necessities of people. Maximum of the societies are hard-pressed out of their communities, as they don't catch the openings to live at ease.

Reimbursement is a troublesome happening by means of numerous inferences designed for health. Stressors, together with intimate departure, acculturation, business insecurity, delimited mobility. Constant worry is supposed to be present to the degree that an individual delineates a relevant state of affairs as distressing for himself or herself and is impotent to apprentice effective muddle through mechanisms to get rid of or ease the disturbance. The bond sandwiched between migration and stress may be there well thought-out on two points that diverge diagnostically in relationships of the presumed route of grounds and end product. On the one hand, hassle of innumerable categories may possibly be there believed to cause migration; on the other, stress may well be noticed as a product of migration.

The asylum seeker may know-how ups and downs in climate, side by side of sanitation, and relating to diet habits, as well as acquaintance to pollution, new-fangled pathogens, and widespread diseases. Fluctuations in climate, in coincidence with the fresh culture, may bring ups and downs in way of life that articulates themselves in arrangements of sleep, nutrition, and scheduling of meals. All these physical changes may, under certain circumstances, work for as stressors. The association stuck between trauma and movement makes unblemished the potential for malady as an ending of the immigration process. Despite the fact lack of ability to muddle through by means of stressors can have many results; one of the most undeviating is somatization and psychological distress. Unforeseen domino effect includes an assortment of performances regarded as by well-being possibilities such as smoking, liquor consumption, medication use, and eating complaints.

Table 1 Overview

	Push Factors(Perceived Negatively)	Pull Factors(perceived positively)
Factors of Geographical migration	Natural disasters, crop failure	Attractive environments, such as mountains, sea sides and warm climate, fertile land
Factors of Psycho-social migration	Active religious persecution, epidemics, lack of social mobility, job restrictions	Principles of religious tolerance
Factors of Economic migration	Inordinate transformation of pay scales, lack of services, indebtedness, unemployment homelessness, poverty	Enlightening the financial conditions, social status, enhanced way of life, the brain drain, higher employment,
Factors of Political migration	lack of safety, war, persecution, government restriction	Policies, safe safety, political stability

Conclusion

Migration in today's world is a topic of controversy and discussion all around the world. Every individual yearns for a fully clothed living standard and a desire to travel to a lushly cultivated section of the country's state or city. They speak up because they know it will provide them with more opportunities in their lives. Their basic needs were met as a result of this process. Individuals who live in technologically advanced cities almost definitely demand all of the extravagances and comforts. Typically, the offspring are on the lookout for a good education, good job chances, and a fair standard of life. When people relocate to or from a certain section of an urbanised zone, their speed of foundation is affected in both positive and negative ways. Migration is an important factor in improving people's quality of life. Skilled workers play a critical part in the region's economic development. A large number of migrants are illiterate and uneducated. Poverty makes them incapable of leading a normal and healthy life. Due to a bevy of health-related assumptions, reimbursement is a challenging event. Stressors include intimate departure, acculturation, business insecurity, and limited mobility. The relationship between migration and stress may be well-thought-out on two aspects. The unanticipated domino effect covers a variety of behaviours associated with poor health, such as smoking, consuming alcoholic beverages, using medications, and complaining about food. Because of the strong link between trauma and movement, the risk of illness as a result of the immigration process is considerable. The waves of migration to a technologically advanced place are encouraging since sophisticated young people are flocking to these areas. At the same time, the waves of travel in the area from where they roam have a negative impact because these young skilled kids have not worked for their community.
